

Embed a LinkedIn Post on a page

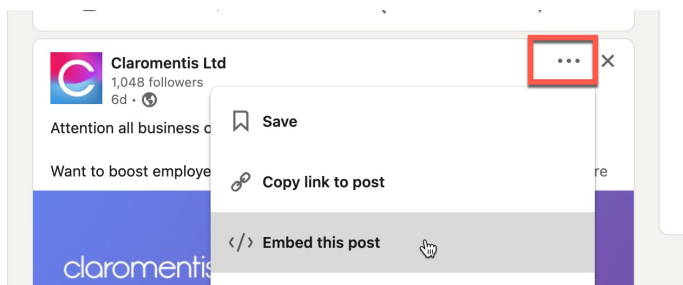

A whole feed cannot be displayed as the LinkedIn policy does not allow this; to get multiple posts on an Intranet page, use multiple embed components

Step 1:

Navigate to the post you want to embed on LinkedIn.

Step 2:

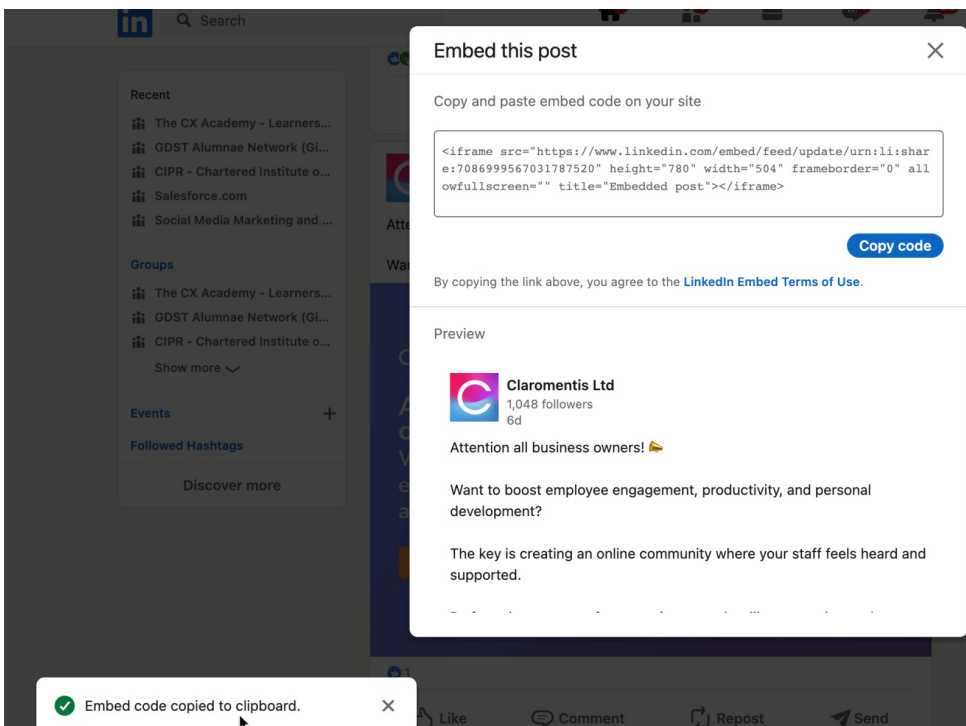

Click the 'More' icon in the top right corner of the post. and then click 'Embed this post'.

Step 3:

Click **Copy code** from the pop-up window that appears.

You'll receive a notification in the bottom left corner of your screen telling you that the code has been copied to your clipboard.

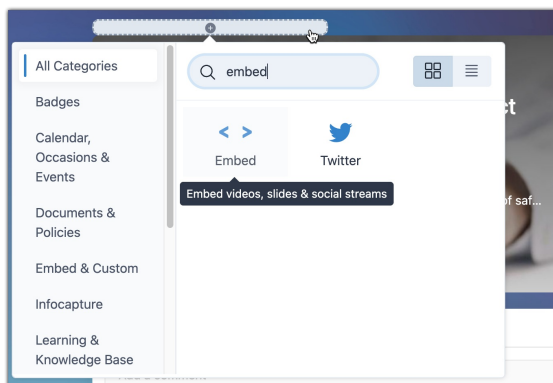

Step 4:

In Claramentis, [edit the page](#) you want to publish the post on.

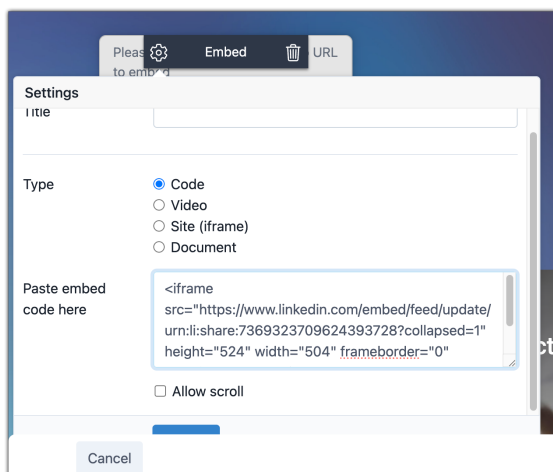

Click in white space to bring up the component menu.

Search for 'embed' and click on this to add it to the page.

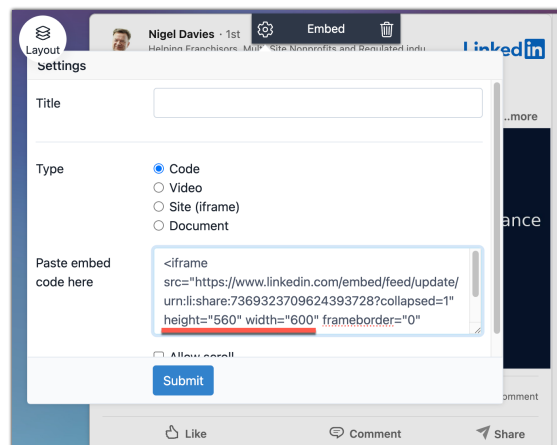

Step 5:

Paste the copied code from LinkedIn into the embed component 'code' type, and the post should pull through.

Step 6:

In the code the height and width values can be manually edited to change the size of the post within the component to achieve the best fit.

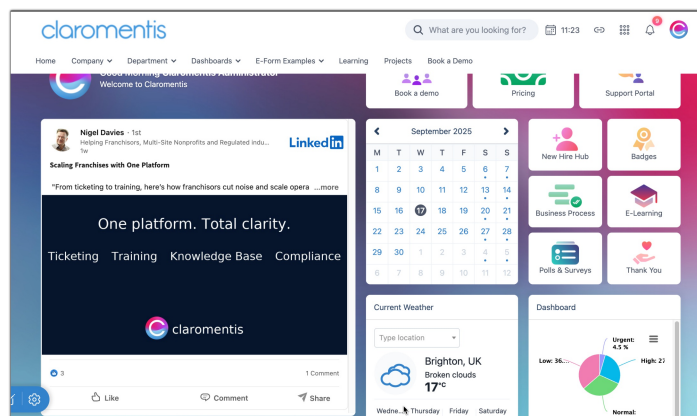

Step 7:

Resize the component as required and tweak the height & width values further if needed, then publish your page to save changes.

Step 8:

The post should be visible on the page.

More embed components can be added to host other posts as necessary.
