

Help! Error when trying to embed a site

by Hannah Door on 4 February 2019

Problem

Help! I'm getting this error when trying to embed a link. The link is in the correct format and does work in the browser.

Reasons

There are some websites that do not allow its content to be embedded in an iframe, for example Facebook.com.

How they've done this?

There is a special tag called The x-Frame-Options HTTP response header that can be used to indicate whether or not a browser should be allowed to render a page in an iframe. A site can use this to avoid clickjacking attacks.

Is there a workaround?

There isn't any workaround, although many of modern web application provides API (Application Programming Interface) that allows some level of integration including displaying content onto another

sites. If you have any specific requirement please submit a change request and one of our technicians can help you investigate.
