

Help! Error When Embedding a Site

Problem

I'm getting this error when trying to embed a link. The link is in the correct format and does work in the browser.

Cause

Some websites do not allow their content to be embedded in an iframe, for example, Facebook.com.

This is implemented by the owner of the website and, therefore, is not within Claromentis' jurisdiction to change.

How did they do this?

There is a special tag called the x-Frame-Options HTTP response header that can be used to indicate whether or not a browser should be allowed to render a page in an iframe.

A site can use this to avoid clickjacking attacks.

Is there a fix?

There isn't any fix to investigate, as the choice to allow embedding is up to the website owner.

 $\label{eq:content} \mbox{A workaround within Claroment is is to link the content you were trying to embed differently.}$

 $e.g.\ consider\ creating\ a\ Button,\ menu\ item\ or\ clickable\ image\ for\ users\ to\ open\ the\ content\ through\ instead.$

However, many modern web applications provide an API (Application Programming Interface) that allows some level of integration, including displaying content on other sites.

If you have any specific requirements, please submit a change request, and one of our technicians can help confirm whether the content you want to embed can be made possible.
