

Adding a Zoom meeting to a page

Embedding a Zoom meeting into a Pages page can be a useful thing for things like webinars, recurring departmental meetings or an open 'break room', which people can drop in and out from.

Sounds good! How do I do that?

To add this to a page, you simply need to add an **Embed** component and use the following code:

```
<iframe allow="microphone; camera" style="border: 0; height: 100%; left: 0; position: absolute; top: 0; width: 100%;" src="https://success.zoom.us/jc/join/{meeting ID}" frameborder="0"></iframe>
```

Make sure you use the correct meeting ID instead of the curly brackets, resize the component to a nice size and you're good to go!

Users will be required to either login within the embedded screen or they can join as a guest if this is configured to be allowed in the meeting's settings.

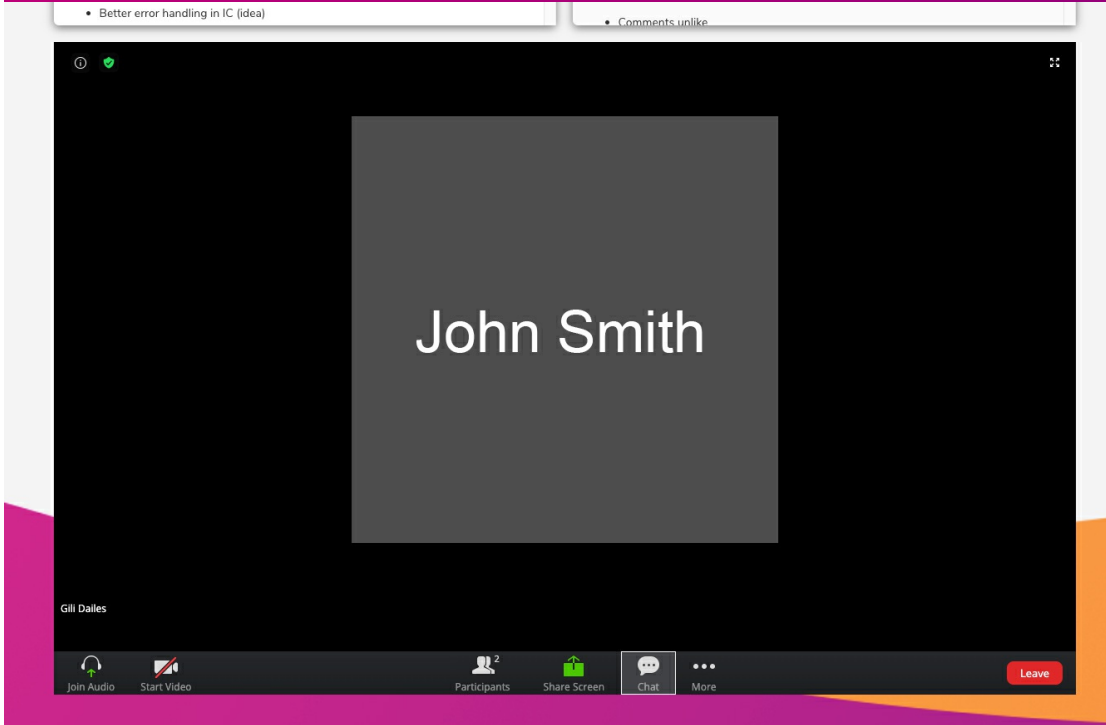

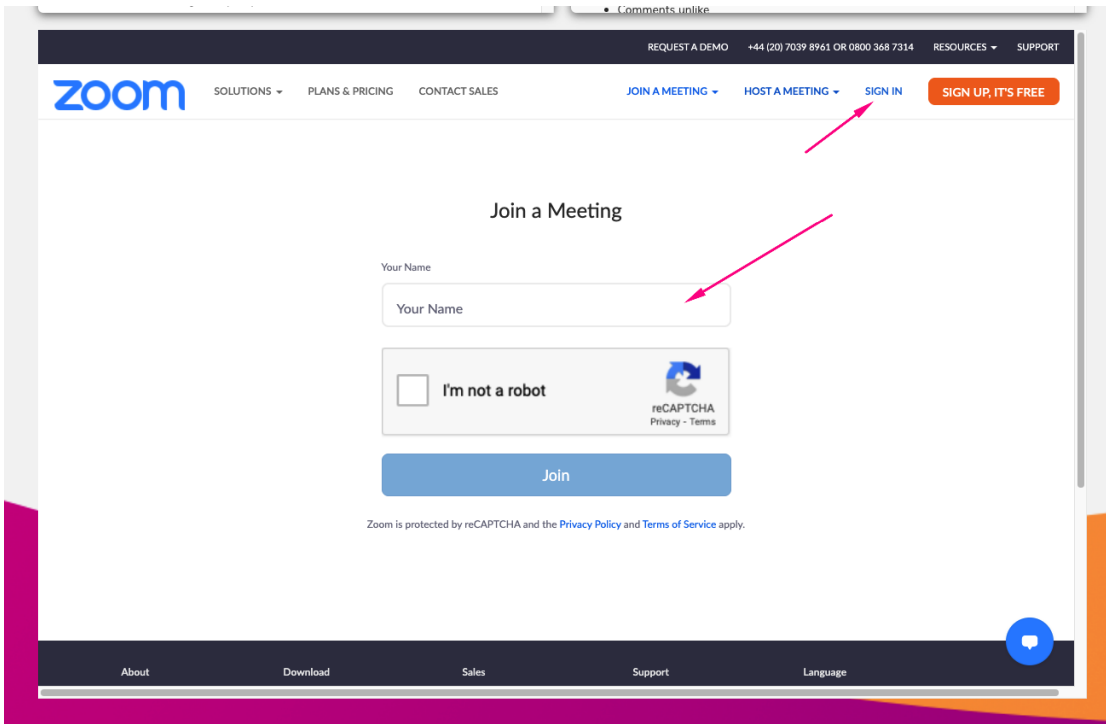

Keep in mind that this will work best for a permanent meeting ID, otherwise the Pages editor will need to edit the component's source code very often.

Visual guide

A screenshot of the Zoom website's 'Embed' settings dialog. The dialog is titled 'Settings' and has a 'Title' field. Under 'Type', there are three radio buttons: 'Code' (selected), 'Video', and 'Site (iframe)'. Below this is a 'Paste embed code here' field containing the following code:

```
<iframe allow="microphone; camera" style="border: 0; height: 100%; left: 0; position: absolute; top: 0; width: 100%;" src="https://success.zoom.us/jc/join/{meeting ID}" frameborder="0"></iframe>
```

 There is a checkbox for 'Allow scroll' which is checked. At the bottom of the dialog is a 'Submit' button. Below the dialog is a 'Join' button. The background shows the Zoom website interface with a navigation bar and a footer.
