

Forcing a Google Font as the System Font

Google provides a wide range of [fonts](#) that can be embedded onto other sites.

In Claromentis, these can be forced as the overall system font or added to CK Editor to appear for [selection](#) when creating content in News, Knowledge Base, Blog, and Pages (using Text component).

Warning: If your system is hosted on-premise you may have restrictions around Google Fonts due to firewall rules.

There are hardcoded font selections that appear in Claromentis when editing the style of the [Master Design](#) or a [Theme](#):

[Watch browser default font video](#)
Please download the file [video/mp4](#)

However, it is possible to override the selection made in the Design panel and instead force the system font to be one from Google.

Please note: Adding too many web fonts can increase load time and decrease system performance, so choose only the most important to add.

Example video of steps

[Watch browser default font video](#)
Please download the file [video/mp4](#)

Written steps

1. Head to the [Google Fonts](#) website.
2. Click on the font you wish to add and select **Get font** to add it to the basket.
3. In the basket, click **Get embed code**:

The screenshot shows the Google Fonts selection interface. On the left, a sidebar lists categories: Fonts, Noto, Icons, Knowledge, and FAQ. The main content area shows the font family 'Playwrite Hrvatska' selected. The font preview displays the text 'Nitko ne smije biti podvrgnut' in an italicized, rounded font. Below the preview, a 'How to use' section is visible, along with tabs for All, Design, Develop, and Google products. A 'Get embed code' button is highlighted with a red box in the top right corner. At the bottom, there are download options for 'Font files' and 'Font API'.

4. Ensure all variants are included (the code will not work if certain options are deselected).

This ensures the system applies the font correctly when made **Bold** and *Italic*.

The screenshot shows the 'Embed code' page for 'Playwrite Hrvatska'. The left side features a preview of the font with the text 'Budući da su priznati'. Below the preview, a 'Weight' section allows selecting 'Full axis' or 'One value'. A '2 styles' section shows 'Italic: 0' and 'Weight: 100 - 400'. The right side displays the 'Web' tab of the embed code options. It includes the 'Web' tab, 'Android', 'iOS', and 'Flutter' tabs. The 'Web' tab shows the selected 'Web' option (radio button) and the 'Embed code in the <head> of your html' section. The code is as follows:

```
<link rel="preconnect" href="https://fonts.googleapis.com">
<link rel="preconnect" href="https://fonts.gstatic.com" crossorigin>
<link href="https://fonts.googleapis.com/css2?family=Playwrite+HR:wght@100..400&islay=swap" rel="stylesheet">
```

Below this, the 'Playwrite HR: CSS class for a variable style' section shows the CSS code:

```
// <uniqueifier>: Use a unique and descriptive class name
// <weight>: Use a value from 100 to 400
.playwrite-hr-<uniqueifier> {
  font-family: "Playwrite HR", cursive;
  font-optical-sizing: auto;
  font-weight: <weight>;
  font-style: normal;
}
```

5. Click **Copy code** from the 'Embed code in the <head>' of your HTML section:

Playwrite Hrvatska Variable

Budući da su priznani

Weight: 100 - 400

2 styles: Italic: 0, Weight: 100 - 400

Web, Android, iOS, Flutter

Embed code in the <head> of your html:

```
<link rel="preconnect" href="https://fonts.googleapis.com">
<link rel="preconnect" href="https://fonts.gstatic.com" crossorigin>
<link href="https://fonts.googleapis.com/css2?family=Playwrite+HR:wght@100..400&display=swap" rel="stylesheet">
```

Playwrite HR: CSS class for a variable style:

```
// <uniqueifier>: Use a unique and descriptive class name
// <weight>: Use a value from 100 to 400
.playwrite-hr-<uniqueifier> {
  font-family: "Playwrite HR", cursive;
  font-optical-sizing: auto;
  font-weight: <weight>;
  font-style: normal;
}
```

Copy code

Legacy browser support for variable fonts

6. On your site, head to **Admin > System > Design** and paste the code into the 'Custom code' field in the 'Advanced' tab of either the [Master Design](#) or each [Theme](#):

Custom Code

Copy custom code (for example Google Analytics tracking code) and paste in the text area below.

```
<link rel="preconnect" href="https://fonts.googleapis.com">
<link rel="preconnect" href="https://fonts.gstatic.com" crossorigin>
<link href="https://fonts.googleapis.com/css2?family=Playwrite+HR:wght@100..400&display=swap" rel="stylesheet">
```

To force the font to appear as the system font in every theme, copy and paste the code into the 'Custom code' field in the 'Advanced' section of the Master Design. Make sure that ALL themes have this attribute linked to the Master, otherwise they will not have the code attributed to them.

If the font should only appear as the system font in certain themes, copy & paste the code into the 'Advanced' tab of only those themes.

7. Next, the 'Custom CSS' field in the 'Advanced tab' of the [Master Design](#) or [Theme](#) needs to be updated with a different code to ensure the font is forced as expected.

The red part below can be edited to represent the fonts you are adding:

```
body {
  font-family: "<Font Name>", <style> !important;
}
```

Usually, the 'CSS class for a variable style section' on the Google Fonts website will give the answers required here (as shown in the example video)

The screenshot shows the Google Fonts website interface. On the left, a sidebar contains icons for A (Fonts), Noto (Noto), Icons (Icons), and Knowledge (FAQ). The main content area is titled "Google Fonts" and shows the "Playwrite Hrvatska" font. A "Variable" button is present. The font preview shows the text "Budući da su priznati". Below the preview, a "Weight" section allows selecting "Full axis" or "One value" (set to 100 - 400). A "2 styles" section shows "Italic: 0" and "Weight: 100 - 400". The "Web" tab is selected in the top navigation bar, which also includes "Android", "iOS", and "Flutter". Under the "Web" tab, there are two radio buttons: "<link>" (selected) and "@import". Below them is a section titled "Embed code in the <head> of your html" containing the following code:

```
<link rel="preconnect" href="https://fonts.googleapis.com">
<link rel="preconnect" href="https://fonts.gstatic.com" crossorigin>
<link href="https://fonts.googleapis.com/css2?family=Playwrite+HR:wght@100..400&islo
```

A "Copy code" button is available. Below this is a section titled "Playwrite HR: CSS class for a variable style" containing the following code:

```
// <uniquerifier>: Use a unique and descriptive class name
// <weight>: Use a value from 100 to 400

.playwrite-hr-<uniquerifier> {
  font-family: "Playwrite HR", cursive;
  font-optical-sizing: auto;
  font-weight: <weight>;
  font-style: normal;
}
```

A "Copy code" button is available. At the bottom, there is a link to "Legacy browser support for variable fonts" and a "Read our FAQ" link. A "API Docs" button is at the bottom right.

8. Once the code has been edited correctly paste this into the 'Custom CSS' field on your site and scroll to the bottom of the screen to click **Save** to apply.

Appearance Interface & Navigation Tab Properties Advanced

Custom CSS (Advanced)

Use this area to add custom CSS rules to your site.

Warning: Please be cautious when using this feature as custom CSS can break your design. Our support team will be limited in how they can help with design related issues if you have custom CSS.

```
body {  
  font-family: "Playwrite HR", cursive !important;  
}
```

Custom Code

Copy custom code (for example Google Analytics tracking code) and paste in the text area below.

```
<link rel="preconnect" href="https://fonts.googleapis.com">
```

9. If you were already looking at a theme where the new font was forced, this will update immediately on saving.

If you are not you will need to switch to a theme where this was updated to check the font appears when viewing it.
